

Project Design Phase Proposed Solution Template

Date	31 July 2026
Team ID	
Project Name	ServiceNow-Based Employee Laptop Request Application
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Employees face delays and zero visibility when requesting a new, replacement, or upgraded laptop. The process today relies on manual emails, phone calls, chat messages and spreadsheets between the employee, manager and IT team, causing onboarding delays, lost productivity and repeated follow-ups.
2.	Idea / Solution description	A ServiceNow-based Employee Laptop Request Application on the Service Portal, where an employee raises a request through a guided catalog item. Flow Designer automatically routes it for manager and IT approval, the CMDB checks live asset stock, and the employee receives real-time status updates and notifications until the laptop is delivered.
3.	Novelty / Uniqueness	Brings self-service request intake, automated multi-level approval workflow, live CMDB-based inventory validation, and Predictive Intelligence-based configuration recommendation together on one platform — replacing today's disconnected emails, calls and spreadsheets with a single auditable workflow.
4.	Social Impact / Customer Satisfaction	New employees become productive from day one instead of waiting on a laptop; all employees get full visibility into request status, cutting down frustration and repeated follow-ups; IT staff are freed from manual tracking and can focus on higher-value support work.
5.	Business Model (Revenue Model)	Deployed as an internal enterprise efficiency application — value is realized through reduced IT helpdesk workload, faster onboarding and better asset utilization (cost-avoidance / productivity model). The catalog item and workflow can also be packaged as a licensable ServiceNow Store app for other organizations.
6.	Scalability of the Solution	Built on ServiceNow's multi-instance SaaS architecture, so it scales across departments, business units and geographies without additional infrastructure. The same catalog-and-workflow pattern can be extended to other asset types such as mobiles, monitors and peripherals with minimal configuration.
